

Usando o sensor DHT11 TEMPERATURA E UMIDADE

Este sensor inclui um componente medidor de umidade e um componente NTC para temperatura, ambos conectados a um controlador de 8-bits.

Conectando o sensor DHT11 ao Arduino:

O DHT11 possui 4 terminais sendo que somente 3 são usados: GND, VCC e Dados.

Fonte: Arduino&Cia

```

#include "DHT.h"
#define dht_type DHT11 //define qual o tipo de sensor DHTxx que se está utilizando
int dht_pin = A2;
DHT dht_1 = DHT(dht_pin, dht_type); //pode-se configurar diversos sensores DHTxx

void setup()
{
  Serial.begin(9600);
  dht_1.begin();
}

void loop()
{
  float umidade = dht_1.readHumidity();
  float temperatura = dht_1.readTemperature();
  if (isnan(temperatura) or isnan(umidade))
  {
    Serial.println("Erro ao ler o DHT");
  }
  else
  {
    Serial.print("Umidade: ");
    Serial.print(umidade);
    Serial.print(" %");
    Serial.print(" Temperatura: ");
    Serial.print(temperatura);
    Serial.println(" °C");
  }
  delay(2000);
}

```

USANDO SENSOR LDR - LUMINOSIDADE

sketch_aug27a | Arduino 1.8.5

Arquivo Editar Sketch Ferramentas Ajuda

```
sketch_aug27a

int sensorPin = A0;
int sensorValue = 0;

void setup() {
  Serial.begin(9600);
}

void loop() {
  sensorValue = analogRead(sensorPin);
  Serial.println(sensorValue);
}
```

Calculando lux (código bônus)

```
ldr_5$  
  
int ldr_pin = A5;  
int ldr_read = 0;  
float vin = 5.00;  
float valor_ADC = 0.00488758, r_ohms = 10000;  
  
void setup() {  
  Serial.begin(9600);  
}  
  
void loop() {  
  if(isnan(ldr_read)){  
    Serial.println("Erro ao ler o sensor");  
  }  
  else{  
    ldr_read = analogRead(ldr_pin);  
    float vout = valor_ADC * ldr_read;  
    float res_ldr = (r_ohms * (vin - vout))/vout;  
    float lux = 500/(res_ldr/1000);  
  
    /*  
    * Checando a voltagem  
    * Quanto maior a incidência de luz menor a resistência do sensor  
    */
```

```

if(ldr_read > 750){
    Serial.print(ldr_read);
    Serial.print(" Vout: ");
    Serial.print(vout);
    Serial.print(" R_ldr: ");
    Serial.print(res_ldr);
    Serial.print(" Lux: ");
    Serial.print(lux);
    Serial.println(" Claro");
}
else{
    Serial.print(ldr_read);
    Serial.print(" Vout: ");
    Serial.print(vout);
    Serial.print(" R_ldr: ");
    Serial.print(res_ldr);
    Serial.print(" Lux: ");
    Serial.print(lux);
    Serial.println(" Escuro");
}
}
delay(2000);
}

```

USANDO - Sensor Óptico Reflexivo TCRT5000

```

tcr5000
int pinoSensor = 7;

void setup() {
  pinMode(pinoSensor, INPUT);
  Serial.begin(9600);
}

void loop() {
  if(digitalRead(pinoSensor) == LOW){
    Serial.println("Objeto: Detectado");
  }
  else{
    Serial.println("Objeto: Ausente");
  }
  delay(3000);
}

```
